Charging <sup>7</sup>	Design	Excellence
Charging port	CCS2	CCS2
Max. AC charging power	11kW	11kW
AC charging time (11kW 3-phase) 0-100%	8 h	8 h
Max. DC charging power	220kW	220kW
DC charging time SOC 10%-80%	25 min	25 min

<sup>5</sup>. Power consumption is calculated in accordance with Regulation (EU) 2017-1151.

<sup>6</sup>. The WLTP range and consumption values are obtained under standard EU test conditions, according to the uniform provisions concerning the approval of motor vehicles with regard to the emissions based on the new World Harmonized Light Vehicle Test Procedure (WLTP). The actual range and energy consumption figures may vary due to a number of factors such as weather conditions, traffic situation, vehicle load and driving behaviours.

<sup>7</sup>. When using a high-performance DC ultra-fast charging pile (350kW and above charging piles are recommended), the vehicle can charge the power battery from SOC 10% to 80% in as little as 25 minutes, with a maximum DC charging power of 220kW. The above data are test results of the new ATTO 3 model under the ambient temperature condition of 25°C. The actual DC charging power is affected by various factors, including ambient temperature, battery temperature, initial charging SOC, intelligent distribution of grid load at the charging station, and vehicle usage conditions. In low-temperature environments, the vehicle's DC charging power will decrease; it is recommended to activate the charging preheating function in advance. The charging power displayed on the vehicle instrument panel is affected by electrical equipment such as air conditioning, and may be lower than the output power of the charging pile during daily charging, which is a normal phenomenon.
